- Solvable through well-known methods

The primary goal when dealing with elementary differential equations is to find the explicit function(s) that satisfy the given relation between the function and its derivatives.

Classification of Elementary Differential Equations

Understanding the types of elementary differential equations is crucial for selecting appropriate solution techniques. They are broadly classified into:

1. First-Order Differential Equations

These involve the first derivative of an unknown function:

$$\frac{dy}{dx} = f(x, y)$$

$$\frac{dy}{dx} = f(x, y)$$

$$\frac{dy}{dx} = f(x, y)$$

Common types include:

- Separable Equations: Can be written as $\frac{dy}{dx} = g(x)h(y)$

3. Homogeneous and Exact Equations

- Homogeneous equations: Substitution $y = vx$ simplifies the problem
- Exact equations: Verify $\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$, then integrate to find solutions

4. Characteristic Equation Method

Primarily used for linear constant-coefficient second-order differential equations:

[

$$a \frac{d^2 y}{dx^2} + b \frac{dy}{dx} + c y = 0$$

]

Solution involves solving the characteristic equation:

$\backslash$

$$ar^2 + br + c = 0$$

 $\backslash$

What Are Elementary Differential Equations?

At their core, elementary differential equations are equations involving derivatives of an unknown function with respect to one or more variables. They are classified based on the order (the highest derivative present), linearity, and the type of functions involved. These equations often appear in problems where the rate of change of a quantity depends on the quantity itself or other related

quantities.

Types of Differential Equations

Differential equations can be broadly categorized into:

- Ordinary Differential Equations (ODEs): Involve derivatives with respect to a single independent variable.
- Partial Differential Equations (PDEs): Involve derivatives with respect to multiple variables.

This guide focuses on elementary ordinary differential equations, which are typically introduced early in calculus and differential equations courses.

Basic Forms of Elementary Differential Equations

Understanding the structure and types of elementary differential equations is crucial for solving them effectively.

First-Order Differential Equations

These involve the first derivative of the unknown function:

$$\left[\frac{dy}{dt} = f(t, y) \right]$$

Common forms include:

- Separable equations: Can be written as $\left[\frac{dy}{dt} = g(t)h(y) \right]$
- Linear equations: Of the form $\left[\frac{dy}{dt} + p(t)y = q(t) \right]$
- Exact equations: Satisfy a specific condition allowing them to be integrated directly.

Higher-Order Differential Equations

These involve derivatives of order two or higher, such as:

$$\left[\frac{d^2 y}{dt^2} + p(t) \frac{dy}{dt} + q(t)y = r(t) \right]$$

While more complex, many techniques for first-order equations extend to higher orders.

Methods for Solving Elementary Differential Equations

Different types of elementary differential equations require different solution techniques. Understanding these methods allows for systematic problem-solving.

- Separation of Variables

Applicable to: Separable equations.

Approach:

- Rewrite the equation as $\frac{dy}{dt} = g(t) h(y)$
- Rearrange to isolate variables:

$$\frac{1}{h(y)} dy = g(t) dt$$

- Integrate both sides:

$$\int \frac{1}{h(y)} dy = \int g(t) dt + C$$

Example:

Solve $\frac{dy}{dt} = y$

Solution:

$$\frac{dy}{y} = dt$$

$$\ln|y| = t + C$$

$$y = \pm e^{t+C} = Ce^t$$

- Integrating Factors (for Linear Equations)

Applicable to: First-order linear equations.

Form:

$$\frac{dy}{dt} + p(t)y = q(t)$$

Approach:

- Find the integrating factor:

$$\mu(t) = e^{\int p(t) dt}$$

- Multiply the entire differential equation by $\mu(t)$:

$$\mu(t) \frac{dy}{dt} + \mu(t) p(t) y = \mu(t) q(t)$$

- Recognize the left side as the derivative of $\mu(t) y$:

$$\frac{d}{dt} [\mu(t) y] = \mu(t) q(t)$$

- Integrate both sides:

$$\mu(t) y = \int \mu(t) q(t) dt + C$$

- Solve for y :

$$y(t) = \frac{1}{\mu(t)} \left(\int \mu(t) q(t) dt + C \right)$$

- Homogeneous Equations

Applicable to: Equations where functions are homogeneous of a certain degree.

Approach:

- Substitute $y = vx$ or similar to reduce to a simpler form.
- Use substitution to convert the equation into a separable form.

- Exact Equations

Applicable to: Equations of the form $M(t, y) + N(t, y) \frac{dy}{dt} = 0$, where M and N satisfy the exactness condition:

$$\frac{\partial M}{\partial y} = \frac{\partial N}{\partial t}$$

Approach:

- Find a potential function $\Psi(t, y)$ such that:

$$\frac{\partial \Psi}{\partial t} = M(t, y)$$

$$\frac{\partial \Psi}{\partial y} = N(t, y)$$

- The solution is then given implicitly as:

$$\Psi(t, y) = C$$

Special Techniques and Considerations

While many elementary differential equations are straightforward to solve, some require more nuanced approaches.

- Substitutions

Transforming variables can simplify complex equations.

- Bernoulli equations:

$$\frac{dy}{dt} + p(t)y = q(t)y^n$$

Use substitution $z = y^{1-n}$ to linearize.

- Homogeneous equations:

Substitution $y = vx$ or y/x helps reduce to separable form.

- Series Solutions

When explicit solutions are difficult, power series methods can approximate solutions near a point.

- Numerical Methods

For equations without closed-form solutions, methods like Euler's method or Runge-Kutta algorithms provide approximate solutions.

Applications of Elementary Differential Equations

Knowing how to formulate and solve elementary differential equations is vital for modeling real-world phenomena:

- Population Dynamics: Models like logistic growth:

$$\left[\frac{dy}{dt} = r y \left(1 - \frac{y}{K} \right) \right]$$

- Radioactive Decay: Exponential decay equations:

$$\left[\frac{dy}{dt} = -\lambda y \right]$$

- Newton's Law of Cooling: Describes temperature change:

$$\left[\frac{dT}{dt} = -k (T - T_{\text{ambient}}) \right]$$

- Electrical Circuits: RC and RL circuits modeled by differential equations involving current and voltage.

Summary and Key Takeaways
