Solution Outline:

- Start with the assumptions of classical particles, distinguishable and non-interacting.
- Write the probability of a particle having velocity $\mathbf{v}$ proportional to the Boltzmann factor $\exp\left(-\frac{1}{2} m \mathbf{v}^2 / k_B T\right)$.

Microstates and Macrostates

One of the fundamental ideas in statistical mechanics is the distinction between microstates and macrostates. Microstates represent the detailed configurations of all particles in a system, while macrostates are characterized by macroscopic variables like temperature, pressure, and volume. The statistical approach involves counting microstates consistent with a macrostate to determine probabilities and thermodynamic properties.

Ensembles in Statistical Mechanics

Ensembles are theoretical constructs that represent large collections of virtual copies of a system, each corresponding to a possible microstate. The main types of ensembles discussed in Phys429 include:

- Microcanonical Ensemble: Fixed energy, particle number, and volume.
- Canonical Ensemble: Fixed temperature, particle number, and volume.
- Grand Canonical Ensemble: Fixed temperature, chemical potential, and volume.

Understanding these ensembles allows students to derive thermodynamic quantities under different physical conditions.

Entropy and the Boltzmann Principle

Entropy quantifies the degree of disorder or the number of microstates corresponding to a macrostate. According to Boltzmann's famous formula:

$$S = k_B \ln \Omega$$

where S is entropy, k_B is Boltzmann's constant, and Ω is the number of microstates. This relation links microscopic configurations with macroscopic thermodynamic properties.
