Multiple-Choice Example:

Which of the following study designs is best suited to establish a temporal relationship between exposure and disease?

- A) Cross-sectional study
- B) Case-control study
- C) Cohort study
- D) Ecological study

Correct Answer: C) Cohort study

Short-Answer Example:

Define 'confounding' in epidemiology and describe one method to control for confounding in analytical studies.

Sample Response:

Confounding occurs when an extraneous variable is associated with both the exposure and the outcome, potentially distorting the true association. One method to control for confounding is stratification, where data are analyzed within strata of the confounder to assess the exposure-outcome relationship independently of that variable.

Data Interpretation Exercise:

Given a 2x2 table of exposure and disease status, calculate the odds ratio and interpret its meaning.

| | Disease Present | Disease Absent | Total |

|-----|-----|-----|-----|

| Exposed | 50 | 150 | 200 |

| Unexposed | 30 | 170 | 200 |

Answer:

Odds of disease in exposed = $50/150 = 0.333$

Odds in unexposed = $30/170 \approx 0.176$

Odds Ratio (OR) = $0.333 / 0.176 \approx 1.89$

Interpretation:

Individuals exposed have approximately 1.89 times higher odds of disease compared to unexposed individuals, suggesting a potential association.

Scenario-Based Question:

You are investigating a sudden outbreak of foodborne illness. Describe the key steps you would take in your investigation, including data collection, hypothesis generation, and analytical methods.
