Deep Dive into Cast Iron Types and Their Properties

One of the core strengths of the ASM Specialty Handbook is its meticulous classification and comparison of cast iron types. Understanding these differences is crucial for selecting the appropriate material for specific applications.

Gray Cast Iron

Gray cast iron is the most common form, characterized by its flake-shaped graphite inclusions that give it a gray fracture surface. Its properties include:

- Good machinability
- High thermal conductivity
- Moderate tensile strength
- Excellent damping capacity

Applications range from engine blocks to pipes and machine bases. However, its brittleness limits applications requiring high impact resistance.

ductile (Nodular) Cast Iron

Nodular cast iron contains spherical graphite particles, which enhance ductility and toughness. Key features include:

- High tensile strength
- Good ductility
- Improved impact resistance

Common uses include crankshafts, gears, and pump housings. The microstructure is primarily ferritic or pearlitic matrix with spheroidal graphite, optimized through magnesium treatment.

White Cast Iron

White cast iron has cementite and pearlite microstructures, with no graphite present. Its high hardness and wear resistance make it suitable for:

- Wear-resistant surfaces
