- Broaching Machine: For internal and external surface shaping.

- Components and Working Principles

Q4: Describe the main components of a lathe machine.

Answer: Key components include the bed, headstock, tailstock, carriage, saddle, cross-slide, tool

post, and feed mechanism.

Q5: Explain the working principle of a drilling machine.

Answer: A drilling machine operates by rotating a drill bit against a workpiece, which is held stationary or moved against the rotating bit. The rotational force and axial feed cause the drill to cut into the material, creating holes.

Q6: What is the purpose of a feed mechanism in machine tools?

Answer: The feed mechanism controls the movement of the cutting tool or workpiece relative to each other, ensuring controlled material removal and surface finish.

- Types and Operations of Machine Tools

Q7: Differentiate between a lathe and a milling machine.

Answer: A lathe primarily works on cylindrical surfaces by rotating the workpiece, while a milling machine uses a rotating cutter to remove material from a stationary workpiece, suitable for machining flat and complex surfaces.

Q8: What are the different types of milling machines?

Answer:

- Horizontal milling machines
- Vertical milling machines
- Universal milling machines
- CNC milling machines

Q9: Describe the operation of a shaper machine.

Answer: A shaper machine uses a single-point cutting tool that reciprocates back and forth across the workpiece to produce flat surfaces, grooves, or slots.

- Tool Holding Devices and Attachments

Q10: What are the common types of tool holders in machine tools?

Answer:

- Lathe tool post
- Milling cutter arbor
- Drill chucks
- Collets
- Tool holders for CNC machines

Q11: Why are attachments used in machine tools?

Answer: Attachments extend the versatility of machine tools, allowing them to perform additional operations such as grinding, boring, or threading without requiring separate machines.

- Machining Parameters and Cutting Data

Q12: What are the main cutting parameters?

Answer:

- Cutting speed
- Feed rate
- Depth of cut
- Width of cut

Q13: How does cutting speed influence machining?

Answer: Higher cutting speeds generally increase material removal rates but can lead to higher tool wear and heat generation. Optimal speeds depend on the material and tool used.

- Types of Machining Processes

Q14: Describe the difference between rough and finish machining.

Answer:

- Rough machining removes large amounts of material quickly with less emphasis on surface

finish.

- Finish machining removes minimal material to achieve the desired surface quality and dimensional accuracy.

Q15: What is the purpose of a boring operation?

Answer: Boring enlarges or finishes an existing hole to precise dimensions and improved surface quality.

- Maintenance and Safety in Machine Tools

Q16: What are common safety precautions while operating machine tools?

Answer:

- Wearing appropriate PPE (Personal Protective Equipment)
- Ensuring guards are in place
- Properly securing workpieces
- Regular inspection and maintenance
- Avoiding loose clothing or jewelry

Q17: How do you maintain machine tools?

Answer: Regular lubrication, cleaning, inspection of parts for wear, calibration, and timely replacement of worn components.

Question What are machine tools and their primary function? Machine tools are mechanical devices used to shape, cut, or form metal or other materials into desired shapes and sizes. Their primary function is to remove material efficiently and accurately to produce finished parts. Name the different types of machine tools commonly used in manufacturing. Common types include lathe machines, milling machines, drilling machines, grinding machines, shaping machines, and slotting machines. What is the difference between a lathe and a milling machine? A lathe primarily rotates the workpiece to perform operations like turning, facing, and threading, whereas a milling machine uses a rotating cutter to remove material from the workpiece in various directions. What are the main parts of a drilling machine? The main parts include the base, column, spindle, table, drill head, and feed mechanism. Explain the concept of 'feed' in machine tools. Feed refers to the distance the tool advances into the workpiece for each revolution or each stroke, controlling the material removal rate and surface finish. What is the purpose of a coolant or lubricant in machining operations? Coolants and lubricants reduce heat generated during machining, minimize tool wear, improve surface finish, and help in easier chip removal. Define 'precision' and 'accuracy' in the context of machine tools. Precision refers to the repeatability of measurements or operations, while accuracy indicates how close a measurement or produced dimension is to the true or desired value. What safety precautions should be taken while operating machine tools? Operators should wear protective gear, ensure proper machine maintenance, avoid loose clothing, keep the work area clean, and follow standard operating procedures. What are cutting tools and their significance in machine tools? Cutting tools are specialized tools used to remove material from the workpiece. Their design and material significantly influence the efficiency, surface finish, and accuracy of machining operations. Explain the concept of 'clamping' in machine tools. Clamping involves securing the workpiece firmly to the machine to prevent movement during machining, ensuring accuracy, safety, and quality of the final product.
