Whether you're aiming to ace your exams or deepen your knowledge, having a well-structured set of notes on web technology can make all the difference. This article offers a detailed, reader-friendly overview of essential concepts, frameworks, and tools that are frequently covered in UPTU exams, presenting them in an accessible yet technical manner.

Introduction to Web Technology

Web technology forms the backbone of the internet and web applications, enabling users to access, interact, and manipulate information seamlessly. It encompasses a wide range of tools, protocols, languages, and frameworks designed to facilitate communication between clients and servers. For UPTU students, understanding these fundamentals is crucial because they form the basis for more advanced topics like web development, security, and cloud computing.

Core Components of Web Technology

- Web Browsers and Web Servers

Web Browsers: Applications like Chrome, Firefox, Safari, and Edge serve as the client-side interface for users. They interpret HTML, CSS, and JavaScript to render web pages.

Web Servers: Servers such as Apache, Nginx, or Microsoft IIS store, process, and deliver web content upon client requests. They handle protocols like HTTP and HTTPS to facilitate communication.

Key Points:

- Web browsers send HTTP requests and interpret HTTP responses.
- Web servers respond to requests by serving static content (images, HTML files) or dynamic content generated via server-side scripts.

- Protocols: HTTP and HTTPS

HTTP (HyperText Transfer Protocol): The foundation of data communication on the web. It follows a request-response model, where clients send requests to servers, which respond with the requested resources.

HTTPS: Secure version of HTTP, encrypting data using SSL/TLS to ensure confidentiality and

integrity.

Important Aspects:

- Stateless protocol: Each request is independent.
- Methods like GET, POST, PUT, DELETE used for different operations.
- Status codes (e.g., 200 OK, 404 Not Found) indicate request outcomes.

Web Technologies and Languages

- HTML (HyperText Markup Language)

HTML is the backbone of web content, defining the structure and layout of web pages through tags and elements.

Key Points:

- Elements like `<h1>`, `<p>`, `<img alt="content" />` define content.
- Semantic tags improve accessibility (e.g., `<h1>`, `<h2>`).
- Forms collect user input using `<input type="text"/>`, `<input type="password"/>`.

- CSS (Cascading Style Sheets)

CSS styles HTML elements, controlling layout, colors, fonts, and responsive design.

This tutorial aims to guide you through the core concepts of Oracle ADF, illustrating each with practical examples to help you grasp the fundamentals and start building your own ADF applications.

Introduction to Oracle ADF

Oracle ADF is a Java framework that simplifies the development of enterprise applications by

providing a set of integrated technologies. It leverages Java EE standards such as JavaServer Faces (JSF), Java Persistence API (JPA), and Java Business Integration (JBI), among others.

Key Components of Oracle ADF

Oracle ADF is composed of several key components that work together:

- **ADF Business Components:** Includes Entity Objects, View Objects, and Application Modules for data access and manipulation.
- **ADF Faces:** A rich set of JSF components for creating user interfaces.
- **ADF Controller:** Manages page flow and navigation.
- **ADF Model:** Binds UI components to data sources.
- **ADF Security:** Provides security features to control access.

Understanding these components is fundamental to developing effective ADF applications.

Setting Up the Development Environment

Before diving into coding, set up your environment:

Prerequisites

- Oracle JDeveloper IDE (version 12c or higher recommended)
- Oracle WebLogic Server (bundled with JDeveloper)
- Java Development Kit (JDK 8 or higher)

Installation Steps

- Download and install Oracle JDeveloper from the official Oracle website.
- Configure WebLogic Server within JDeveloper.
- Create a new Fusion Web Application to start your ADF project.

This setup provides a ready-to-use environment for developing ADF applications.

Creating Your First ADF Application

Let's walk through creating a simple application that displays employee data.

Step 1: Create a New Fusion Web Application

- Launch JDeveloper.
- Navigate to File > New > Application.
- Select "Fusion Web Application (ADF)".
- Enter project details and finish.

Step 2: Create Business Components

- Right-click on the Model project.
- Select New > Business Components > Business Components from Tables.
- Connect to your database and select the "Employees" table.
- Generate Entity Objects, View Objects, and Application Module.

Step 3: Create a JSF Page to Display Data

- Right-click on the WebContent > viewController.
- Choose New > JSF Page.
- Use the Data Controls palette to drag the Employees View Object onto the page, creating a table.

Step 4: Run the Application

- Right-click the project and select Run.
- The application opens in the embedded WebLogic Server, displaying employee data in a table.

This simple workflow introduces core ADF concepts: data access, UI creation, and deployment.

Understanding Oracle ADF Architecture with Examples

The architecture of Oracle ADF follows a Model-View-Controller (MVC) pattern, ensuring separation of concerns.

Model Layer: Data and Business Logic

Using ADF Business Components:

```
```java

// Entity Object for Employee

public class EmployeeEOImpl extends EntityImpl {

// Attributes like EmployeeId, Name, Department, etc.

}

// View Object for Employee List

public class EmployeesVOImpl extends ViewObjectImpl {

// Query and data access logic

}

```
```

View Layer: User Interface

Using ADF Faces components in a JSF page:

```
```xml

```
```

Controller Layer: Navigation and Page Flow

Managed beans handle events and navigation:

```
```java

@Named

@RequestScoped

public class EmployeeController {

public String goToDetails() {
```

```
// navigation logic

return "employeeDetails";

}

}

...

```

This layered approach promotes maintainability and scalability.

## Implementing Common ADF Features with Examples

Now, let's look at implementing some common features in ADF.

### Data Binding

Data binding connects UI components to data sources:

```
``xml

...

```

This binds an input field to the EmployeeId attribute.

### Navigation

Define navigation rules in the `adf-config.xml` or use page flow diagrams to manage navigation paths.

Example: Navigating from Employee List to Employee Details.

### Validation

Use Entity Object level validation or create custom validators:

```
``java

@Override

```

```
protected void validateEntity() {

 super.validateEntity();

 if (getAttribute("Salary") != null && (Double)getAttribute("Salary")
 throw new EntityValidationException("Salary cannot be negative");

}

}

...
```

## Security

Implement security by configuring policies in the ADF Security framework, restricting access based on roles.

## Advanced Topics and Best Practices

Once familiar with basics, explore advanced features:

### Customizing UI with ADF Faces

Create custom components and styling to enhance UI.

### Performance Optimization

- Use View Criteria for filtering.
- Implement caching strategies.
- Minimize data fetches with partial page rendering.

## Deployment

Deploy your ADF application on WebLogic Server or other Java EE servers.

## Best Practices

- Follow naming conventions for components and beans.

- Leverage data controls for reusability.
- Use View Criteria for dynamic filtering.
- Implement error handling and logging.

## Conclusion

Oracle ADF is a powerful framework that accelerates enterprise application development through its declarative approach and rich component set. By understanding its architecture, setting up the development environment, and practicing with real-world examples, you can build robust, scalable, and maintainable applications. This tutorial provided a foundational overview, demonstrating key concepts with practical implementations. As you gain experience, explore advanced topics like custom component development, performance tuning, and security integration to fully harness the capabilities of Oracle ADF. Happy coding!

public class EmployeeBackingBean {
```

```
    private Row currentEmployee;
```

```
    public void editEmployee(Row employee) {
```

```
        this.currentEmployee = employee;
```

```
        // Navigate to edit page or open dialog
```

```
}

public Row getCurrentEmployee() {

return currentEmployee;

}

}

...

```

Step 5: Creating the Employee Edit Page

- Add a new JSF page `EmployeeEdit.xhtml`.
- Use `af:inputText` components to bind to the employee's attributes.
- Include Save and Cancel buttons.

```
```xml

```

```
...

```

### Step 6: Handling Data Persistence

In the backing bean, implement `saveEmployee()` and `cancelEdit()` methods to persist changes back to the database.

```
```java

```

```
public void saveEmployee() {

DCBindingContainer bindings = (DCBindingContainer)
BindingContext.getCurrent().getCurrentBindingsEntry();

JUCtrlHierBinding rowBinding = (JUCtrlHierBinding) bindings.findBinding("EmployeesView1");

rowBinding.getDataControl().commitChanges();

// Navigate back to list page

```

```
}
```

```
public void cancelEdit() {
```

```
// Rollback changes
```

```
DCBindingContainer bindings = (DCBindingContainer)  
BindingContext.getCurrent().getCurrentBindingsEntry();
```

```
bindings.clearCurrentRow();
```

```
// Navigate back to list page
```

```
}
```

```
...
```

Question What is Oracle ADF and how does it simplify application development? Oracle Application Development Framework (ADF) is a Java EE framework that simplifies the development of enterprise applications by providing a visual and declarative approach, reusable components, and integrated tools for building rich user interfaces, business logic, and data binding. **How do I create a basic Oracle ADF application step-by-step?** To create a basic Oracle ADF application, start by creating an ADF Fusion Web Application in JDeveloper, define your data model with Entity and View Objects, create a bounded task flow, design your user interface with ADF Faces components, and then deploy and test your application. **Can you provide an example of binding a form to a database table in ADF?** Yes. In JDeveloper, create Entity Objects linked to your database tables, then generate View Objects based on these entities. Drag the View Object into your page as an ADF Form, which automatically binds form fields to the database columns, enabling data display and update functionalities. **What are ADF Faces components and how are they used in tutorials?** ADF Faces components are rich UI elements like tables, forms, and buttons that are used to build interactive web pages. In tutorials, they are demonstrated through examples such as creating input forms, data tables, and navigational controls to enhance user experience. **How to implement navigation between pages in Oracle ADF?** Navigation in ADF is managed using bounded task flows and navigation rules. You define navigation cases in the task flow or in the page definitions, allowing users to move between pages like list views to detail views seamlessly. **What is the role of Application Module in Oracle ADF, and can you give an example?** An Application Module manages the data model and business logic in ADF. For example, you can create an Application Module that exposes a View Object for customer data, enabling multiple pages to access and manipulate this data consistently. **How do I handle validation and error messages in an ADF application?** Validation is handled through built-in validators on UI components or custom validators in the model layer. Error messages are displayed using ADF Faces message components, providing users with real-time feedback during data entry. **Can you give an example of creating a custom ADF**

component? Creating a custom ADF component involves extending existing ADF Faces components or developing new composite components using Java and JSF. An example includes designing a custom date picker with additional validation or styling, integrated into your ADF application. How to deploy an Oracle ADF application to WebLogic Server? Deploying involves generating a WAR or EAR file from JDeveloper and deploying it to WebLogic Server via the WebLogic Admin Console or command-line tools, ensuring all dependencies and data sources are correctly configured for the deployment environment. Where can I find comprehensive Oracle ADF tutorials with practical examples? Oracle's official documentation, Oracle Learning Library, and community sites like Oracle ADF Community and Stack Overflow offer extensive tutorials, sample applications, and practical examples for mastering Oracle ADF development.
