Deep Dive into Programming Techniques

Register-Level Programming

At its most fundamental level, programming involves manipulating device registers directly. This approach offers maximum control but requires detailed knowledge of hardware specifications.

Example: Turning on an LED connected to GPIO pin

```
```c

// Enable GPIOA clock

RCC->AHB1ENR |= RCC_AHB1ENR_GPIOAEN;

// Set PA5 as output

GPIOA->MODER |= GPIO_MODER_MODE5_0;

Hardware Abstraction Libraries

To simplify development, STMicroelectronics provides Hardware Abstraction Layer (HAL) libraries, which encapsulate register manipulations in higher-level APIs.

Example: Using HAL to toggle an LED

```
```c

HAL_GPIO_WritePin(GPIOA, GPIO_PIN_5, GPIO_PIN_SET);

```
```

HAL libraries promote portability and reduce development time, especially for complex projects.

Interrupts and Timers

Real-time responsiveness is often achieved through interrupts and timers.

Implementing a Timer Interrupt:

- Configure the timer peripheral.
- Enable the corresponding interrupt.
- Write an interrupt handler to execute at each timer overflow.

```
```c  

void TIM2_IRQHandler(void) {

 if (TIM2->SR & TIM_SR_UIF) {

 TIM2->SR &= ~TIM_SR_UIF; // Clear interrupt flag

 // Toggle LED or perform task

 }

}

```
```

This approach allows for precise, asynchronous control over hardware events.
