Sample Exercises and Their Solutions

Exercise 1: Creating a Simple Inheritance Hierarchy

Problem:

Create a superclass called `Animal` with a method `makeSound()`. Then, create subclasses `Dog` and `Cat` that override `makeSound()` to provide specific sounds.

Answer Explanation:

This exercise demonstrates inheritance and method overriding. The `Animal` class provides a general structure, and subclasses customize behavior.

```
```java
```

```
public class Animal {
```

```
 public void makeSound() {
```

```
 System.out.println("Some generic animal sound");
```

```
 }
```

```
}
```

```
```
```

```
```java
```

```
public class Dog extends Animal {
```

```
 @Override
```

```
 public void makeSound() {
```

```
 System.out.println("Woof");
```

```
 }
```

```
}
```

```
...
```

```
```java
```

```
public class Cat extends Animal {
```

```
@Override
```

```
public void makeSound() {
```

```
System.out.println("Meow");
```

```
}
```

```
}
```

```
...
```

Usage:

```
```java
```

```
public class TestAnimals {
```

```
public static void main(String[] args) {
```

```
Animal myDog = new Dog();
```

```
Animal myCat = new Cat();
```

```
myDog.makeSound(); // Outputs: Woof
```

```
myCat.makeSound(); // Outputs: Meow
```

```
}
```

```
}
```

```
...
```

This solution highlights core object-oriented principles: inheritance and method overriding.

## Exercise 2: Implementing an Interface

Problem:

Define an interface `Playable` with a method `play()`. Implement this interface in classes `Guitar` and `Piano`, providing specific implementations of `play()`.

Answer Explanation:

Interfaces define a contract that implementing classes must follow, promoting abstraction and flexibility.

```
```java
```

```
public interface Playable {
```

```
    void play();
```

```
}
```

```
```
```

```
```java
```

```
public class Guitar implements Playable {
```

```
    @Override
```

```
    public void play() {
```

```
        System.out.println("Playing the guitar");
```

```
    }
```

```
}
```

```
```
```

```
```java
```

```
public class Piano implements Playable {  
  
    @Override  
  
    public void play() {  
  
        System.out.println("Playing the piano");  
  
    }  
  
}
```

Usage:

```
```java  

public class MusicTest {

 public static void main(String[] args) {

 Playable myGuitar = new Guitar();

 Playable myPiano = new Piano();

 myGuitar.play(); // Outputs: Playing the guitar

 myPiano.play(); // Outputs: Playing the piano

 }

}
```

This exercise emphasizes interface implementation and polymorphism.

### **Exercise 3: Abstract Classes and Method Overriding**

Problem:

Create an abstract class `Shape` with an abstract method `calculateArea()`. Implement subclasses `Rectangle` and `Circle` that provide specific implementations.

Answer Explanation:

Abstract classes serve as base classes that cannot be instantiated directly but can contain abstract methods that must be overridden.

```
```java
```

```
public abstract class Shape {
```

```
    public abstract double calculateArea();
```

```
}
```

```
```
```

```
```java
```

```
public class Rectangle extends Shape {
```

```
    private double length, width;
```

```
    public Rectangle(double length, double width) {
```

```
        this.length = length;
```

```
        this.width = width;
```

```
    }
```

```
    @Override
```

```
    public double calculateArea() {
```

```
        return length * width;
```

```
    }
```

```
}
```

```
```
```

```
```java
```

```
public class Circle extends Shape {
```

```
    private double radius;
```

```
    public Circle(double radius) {
```

```
        this.radius = radius;
```

```
    }
```

```
    @Override
```

```
    public double calculateArea() {
```

```
        return Math.PI * radius * radius;
```

```
    }
```

```
}
```

```
```
```

Usage:

```
```java
```

```
public class ShapeTest {
```

```
    public static void main(String[] args) {
```

```
        Shape rect = new Rectangle(5, 10);
```

```
        Shape circ = new Circle(7);
```

```
        System.out.println("Rectangle area: " + rect.calculateArea()); // 50.0
```

```
        System.out.println("Circle area: " + circ.calculateArea()); // Approx. 153.94
```

```
}
```

```
}
```

```
...
```

This solution demonstrates abstraction and how subclasses implement abstract methods.

Sample MCQs with Answers

Below are illustrative questions covering various aspects of exercise therapy, along with detailed explanations.

Question 1:

Which of the following is NOT a principle of exercise prescription?

- A) Specificity
- B) Overload
- C) Randomness
- D) Progression

Answer: C) Randomness

Explanation:

The core principles of exercise prescription include specificity (training specific to goals), overload (challenging the body beyond habitual levels), progression (gradually increasing intensity), and individualization. Randomness is not a principle; rather, exercise programs should be structured and goal-oriented.

Question 2:

A 55-year-old patient with osteoarthritis of the knee is advised to perform low-impact exercises. Which of the following exercises is most appropriate?

- A) Running on a treadmill
- B) Swimming or aquatic therapy
- C) High-impact aerobics

D) Heavy weightlifting

Answer: B) Swimming or aquatic therapy

Explanation:

Low-impact exercises like swimming reduce joint stress and are suitable for osteoarthritis management. Running and high-impact aerobics can exacerbate joint pain, and heavy weightlifting might not be advisable without proper supervision.

Question 3:

During exercise therapy, which parameter refers to the amount of weight or resistance used?

A) Frequency

B) Intensity

C) Duration

D) Type

Answer: B) Intensity

Explanation:

In exercise prescription, intensity relates to the amount of resistance, weight, or effort involved. Frequency refers to how often exercises are performed, duration to how long each session lasts, and type to the kind of exercise.

Question 4:

Which assessment tool is most appropriate for evaluating a patient's balance before initiating a fall prevention exercise program?

A) Six-Minute Walk Test

B) Berg Balance Scale

C) Visual Analog Scale

D) Range of Motion (ROM) Test

Answer: B) Berg Balance Scale

Explanation:

The Berg Balance Scale specifically assesses balance capabilities and fall risk. The Six-Minute Walk Test measures endurance, VAS assesses pain, and ROM tests evaluate joint flexibility.

Question 5:

In cardiac rehabilitation, which of the following is a contraindication to exercise?

- A) Resting hypertension >200/110 mmHg
- B) Mild fatigue after exercise
- C) Controlled arrhythmias
- D) Post-myocardial infarction within 48 hours

Answer: A) Resting hypertension >200/110 mmHg

Explanation:

Severely elevated blood pressure at rest is a contraindication, as it increases the risk of adverse events during exercise. Controlled arrhythmias and recent MI may require caution but are not absolute contraindications if monitored properly.
