It covers both natural and synthetic fibers, providing methods to assess their dimensional stability after laundering.

Key Aspects of BS EN ISO 12945

Types of Tests Covered

The standard involves two primary testing methods:

- Dimensional Change in Length

Measures the change in fabric length after laundering.

- Dimensional Change in Width

Assesses the width alterations post-wash.

These tests simulate typical laundering conditions to determine fabric stability.

Laundering Conditions

BS EN ISO 12945 specifies standardized laundering procedures, which include:

- Washing Temperature: Usually 40°C or 60°C, depending on fabric type
- Detergent Type: Standard laboratory detergents
- Cycle Duration: Usually 45 minutes
- Mechanical Action: Agitation mimicking domestic washing machines
- Drying Methods: Standardized drying procedures, such as tumble drying or line drying

Adhering to these conditions ensures reproducibility and comparability of test results.

Testing Procedure for Dimensional Stability

Sample Preparation

- Cut fabric specimens into specified dimensions (e.g., 50mm x 200mm).
- Mark reference points if needed for precise measurement.

Laundering Process

- Launder specimens according to the prescribed conditions.
- Repeat the process for multiple cycles if evaluating durability over repeated washes.

Measurement and Calculation

- Measure the dimensions before and after laundering.
- Calculate the percentage change using the formula:

...

Dimensional Change (%) = [(After laundering - Before laundering) / Before laundering] × 100

...

- Record both length and width changes.

Interpreting Results

- Results are compared against acceptable thresholds, often specified by end-use standards or customer requirements.
- Fabrics exhibiting minimal change are considered dimensionally stable.

- Specimen preparation: Fabrics cut into standardized sizes, conditioned at specified temperature and humidity levels before testing.
- Sample mounting: Ensuring uniform placement within the tumbler to avoid bias.

Test Procedure Overview

- Pre-conditioning: Fabrics are conditioned according to ISO standards to ensure consistency.
- Drying cycle simulation: Fabrics are subjected to controlled tumble drying cycles, typically of 30-60 minutes, at specified temperatures (commonly around 60°C).
- Post-drying assessment: Fabrics are evaluated for dimensional changes, surface alterations, and colorfastness.

Detailed Aspects of Testing

- Dimensional Stability Testing

This involves measuring fabric dimensions before and after the tumble drying cycle to quantify shrinkage or growth.

- Measurement parameters: Width, length, and overall fabric dimensions.
- Shrinkage calculation: Expressed as a percentage change relative to initial measurements.
- Acceptance criteria: Based on fabric type and end-use specifications.

- Surface and Structural Evaluation

Assessment of physical changes includes visual and tactile inspections for:

- Pilling: Formation of small fiber balls on the fabric surface.
- Fuzzing: Raised fibers or surface roughness.
- Surface abrasion or roughness: Using standard test methods like the Martindale or Wyzenbeek abrasion tests for deeper analysis.

- Colorfastness Testing

Evaluates whether the dye remains stable after tumble drying cycles, which involves:

- Color measurements: Using spectrophotometers before and after drying.
 - Assessment scales: Typically based on Gray Scale for color change.
 - Factors affecting colorfastness: Fiber type, dye chemistry, finishing treatments.
-
- Mechanical Strength and Integrity
-
- Tensile strength tests: To identify any weakening of fibers or fabric structure.
 - Elongation and tearing resistance: Post-drying measurements to assess durability.

Test Conditions and Parameters

The standard specifies precise test conditions to ensure reproducibility:

Parameter	Typical Specification
Temperature	60°C (± 3°C)
Duration	30-60 minutes per cycle
Rotation speed	45 rpm (± 2 rpm)
Humidity	Controlled to simulate typical household conditions
Specimen size	Typically 10 cm x 10 cm or as specified

Adjustments are made based on fabric type, end-use, and specific testing needs.

Quality Control and Interpretation of Results

Acceptance Criteria

Results are compared against predefined thresholds, which may vary based on:

- Fabric type and intended use
- Consumer or industry specifications
- Endurance expectations

For instance, a fabric may be deemed acceptable if shrinkage does not exceed 3%, surface pilling is minimal, and colorfastness remains within acceptable limits.

Reporting and Documentation

- Test reports include detailed measurements, photographs, and observations.
- Statistical analysis ensures the reliability of results, considering repeatability and reproducibility.

Its detailed methodologies enable manufacturers to produce resilient textiles, assist consumers in making informed choices, and facilitate regulatory compliance. As textile technologies evolve, continuous refinement and application of this standard will ensure it remains relevant, supporting the industry's pursuit of quality, durability, and sustainability.

In summary, understanding and implementing BS EN ISO 12945 is essential for stakeholders across the textile supply chain. Its comprehensive approach to assessing fabric behavior under tumble drying conditions ensures that products meet expectations, reduce waste, and enhance consumer satisfaction.

QuestionAnswer What is the primary purpose of BS EN ISO 12945? BS EN ISO 12945 specifies methods for determining the fabric's breaking force and elongation, ensuring the quality and durability of textiles, especially knitted fabrics. Which types of textiles does BS EN ISO 12945 apply to? It applies mainly to knitted fabrics but can also be used for other textile fabrics where breaking force and elongation are critical parameters. How does BS EN ISO 12945 differ from other fabric testing standards? It provides standardized methods specifically for measuring breaking force and elongation in knitted fabrics, ensuring consistency and comparability across tests, whereas other standards may focus on different properties like abrasion or pilling. What equipment is required to perform tests according to BS EN ISO 12945? A universal testing machine with appropriate grips and a controlled environment is required to measure the breaking force and elongation of fabric samples. How can manufacturers use BS EN ISO 12945 to improve quality control? By regularly testing fabrics according to this standard, manufacturers can ensure their products meet strength

and durability requirements, leading to higher quality and customer satisfaction. What are the typical test conditions specified in BS EN ISO 12945? The standard specifies test parameters such as load cell capacity, testing speed, and sample dimensions to ensure consistent and accurate measurements. Is BS EN ISO 12945 applicable to both new and aged textiles? Yes, it can be used to assess the initial strength of new textiles and to evaluate the degradation or durability of aged fabrics. How does BS EN ISO 12945 influence textile product development? It provides essential data on fabric strength and elongation, helping designers and engineers select appropriate materials and improve fabric formulations for better performance. Are there any recent updates or revisions to BS EN ISO 12945?
