QuestionAnswer What are the main functions of the cardiovascular system covered in BIOL

2402? The cardiovascular system's main functions include transporting nutrients, oxygen, hormones, and waste products; regulating blood pressure; and maintaining homeostasis within the body. How does the sympathetic nervous system influence heart rate in human physiology? The sympathetic nervous system increases heart rate by releasing norepinephrine, which stimulates the sinoatrial node, enhancing cardiac output during stress or activity. What are the structural differences between arteries and veins discussed in BIOL 2402? Arteries have thicker, more muscular walls to withstand higher pressure, and they generally carry oxygen-rich blood away from the heart, whereas veins have thinner walls, valves to prevent backflow, and carry oxygen-depleted blood back to the heart. Can you explain the process of gas exchange in the alveoli as covered in human anatomy? Gas exchange in the alveoli occurs via diffusion, where oxygen moves from the alveolar air into the blood in capillaries, and carbon dioxide moves from the blood into the alveoli to be exhaled. What role do the kidneys play in maintaining acid-base balance in BIOL 2402? The kidneys regulate acid-base balance by reabsorbing bicarbonate and excreting hydrogen ions, helping to maintain blood pH within a narrow, healthy range. How is blood pressure regulated in the human body according to BIOL 2402? Blood pressure is regulated through mechanisms involving the autonomic nervous system, renal function, and hormonal control (such as the renin-angiotensin-aldosterone system), which adjust blood vessel diameter and blood volume. What are the roles of the respiratory and circulatory systems in oxygen delivery? The respiratory system facilitates oxygen intake and carbon dioxide removal through ventilation, while the circulatory system transports oxygenated blood from the lungs to tissues and returns deoxygenated blood to the lungs. Describe the cardiac cycle as studied in BIOL 2402. The cardiac cycle includes systole (contraction of the heart chambers) and diastole (relaxation), coordinating to ensure efficient blood ejection and filling during each heartbeat. What mechanisms are involved in lymphatic circulation in human anatomy? Lymphatic circulation involves the movement of lymph through lymphatic vessels driven by skeletal muscle contractions, valves preventing backflow, and pressure changes during breathing, aiding in immune function and fluid balance. How do hormones regulate blood calcium levels in BIOL 2402? Hormones like parathyroid hormone (PTH) increase blood calcium by stimulating bone resorption, enhancing kidney reabsorption of calcium, and activating vitamin D; calcitonin decreases blood calcium by inhibiting osteoclast activity.
