- Page Navigation: Implemented via URL parameters, navigation actions, or workflow APIs.
- Event Handling: Using predefined or custom event listeners to respond to user actions.

By following the guide, developers can design intuitive workflows that align with business processes.

Implementing Business Logic

The guide offers extensive coverage on embedding business logic within OAF pages while maintaining a clean separation from UI components.

View Objects and Application Modules

- View Objects (VOs): Define the data query logic, filtering, and data retrieval.
- Application Modules (AMs): Serve as containers for VOs, managing transaction boundaries and data consistency.

Best practices include creating well-structured VOs and AMs to promote reusability and ease of maintenance.

Event Handlers and Controllers

- Controller Classes: Extend the `OACController` class to manage page events.
- Method Overrides: Implement `processRequest()` and `processFormRequest()` for request handling.
- Custom Business Logic: Encapsulated within controllers, interacting with VOs and AMs as needed.

The guide stresses testing controllers thoroughly to ensure smooth user interactions.
