Question: Describe how the respiratory system helps maintain homeostasis in the body. Include the role of the lungs and alveoli.

Sample Answer: The respiratory system helps maintain homeostasis by exchanging oxygen and carbon dioxide between the air and the blood. The lungs contain alveoli, tiny air sacs where gas exchange occurs. Oxygen diffuses into the blood, providing cells with the oxygen needed for energy production, while carbon dioxide diffuses out to be exhaled. This process helps regulate blood pH and maintains the body's internal balance.

Sample Topic: Energy Transfer

Question: Explain the difference between conduction and convection. Provide an example of each.

Sample Answer: Conduction is the transfer of heat through direct contact between materials, such as a metal spoon heating up when placed in hot soup. Convection involves the movement of fluids (liquids or gases) to transfer heat, like warm air rising from a heater or boiling water circulating in a pot.
