Definition and Concept

A biorefinery is a facility that integrates biomass conversion processes to produce a spectrum of products, including energy, fuels, chemicals, and materials, from renewable biological resources. Similar to traditional refineries that process crude oil into multiple petroleum-based products, biorefineries aim to convert biomass—such as agricultural residues, forestry waste, energy crops, and organic waste—into a wide array of value-added products through sustainable and efficient processes.

The core idea behind a biorefinery is to maximize resource utilization by cascading biomass into various products, minimizing waste, and optimizing process efficiencies. The concept promotes the use of renewable feedstocks and environmentally friendly technologies, aligning with global efforts to reduce greenhouse gas emissions and foster sustainable development.

Types of Biorefineries

Biorefineries can be classified based on the type of biomass they process, their product focus, or the technological approaches they employ. The main types include:
