Common Questions and Sample Answers in PLTW Unit 3

Below are typical questions students might encounter, along with detailed explanations and sample answers to clarify the reasoning process.

Question 1: Calculating Gear Ratios

If a gear train has a gear A with 20 teeth and gear B with 60 teeth, what is the gear ratio? How does this ratio affect the output speed?

Answer:

- Gear ratio = Number of teeth on driven gear / Number of teeth on driver gear = $60 / 20 = 3:1$.
- Effect on speed: The gear ratio of 3:1 means that for every 3 rotations of gear A (driver), gear B (driven) completes 1 rotation.
- Implication: The output speed decreases by a factor of 3, but torque increases proportionally.

Understanding this helps students see how gear ratios influence the trade-off between speed and torque in mechanical systems.

Question 2: Mechanical Advantage of a Lever

A lever is used to lift a 200 N weight. The effort applied at the other end of the lever is 50 N. What is the mechanical advantage of the lever?

Answer:

- Mechanical advantage (MA) = Load force / Effort force = $200 \text{ N} / 50 \text{ N} = 4$.
- Interpretation: The lever multiplies input force by a factor of 4, making it easier to lift heavy loads with less effort.

This reinforces the concept that simple machines like levers provide mechanical advantage, reducing the effort needed to perform work.

Question 3: Identifying the Type of Mechanism

Given a diagram of a linkage that converts rotary motion into oscillating motion, identify the type of mechanism.

Answer:

- Likely a four-bar linkage or oscillating crank, depending on specific linkages.
- Explanation: Four-bar linkages are common in converting rotary motion into linear or oscillating motion, used in various mechanical devices like windshield wipers or pistons.

Students should analyze the linkage diagram to identify pivot points, link lengths, and the motion path.

Question 4: Calculating Power in a Mechanical System

A motor applies a force of 50 N to move a mechanism at a velocity of 2 m/s. What is the power output?

Answer:

- Power (P) = Force (F) $\times$ Velocity (v) = 50 N $\times$ 2 m/s = 100 Watts.
- Significance: Power measures how quickly work is done; understanding this helps evaluate system efficiency.

Tips for Using Test Answers Effectively

- Use answers as a learning tool: Review explanations to deepen understanding.
- Cross-reference with class notes and textbooks to clarify misconceptions.
- Practice similar problems to reinforce concepts and improve problem-solving speed.

Sample Questions and Answers for PLTW IED Unit 6 Midterm

Below are examples of typical questions you might encounter, along with explanations that can serve as a model for studying.

Question 1: What is the primary purpose of gear trains in mechanical systems?

Answer:

Gear trains are used to transmit torque and rotational motion between shafts, modify the speed and direction of rotation, and provide mechanical advantage in a system. They are essential for adjusting the output speed and torque to meet specific operational requirements.

Question 2: Calculate the gear ratio if gear A has 20 teeth and gear B has 60 teeth, with gear A driving gear B.

Answer:

Gear ratio = Number of teeth on driven gear / Number of teeth on driving gear = $60 / 20 = 3:1$.

This means gear B rotates at one-third the speed of gear A but provides three times the torque.

Question 3: How does increasing the number of teeth on a gear affect the mechanical advantage?

Answer:

Increasing the number of teeth on a gear increases the gear ratio, which enhances the mechanical advantage. This results in higher torque output at the expense of reduced rotational speed, useful in applications requiring increased force.

PLTW IED Unit 6 Midterm Test Answers: An In-Depth Overview and Review

The PLTW IED (Principles of Engineering) Unit 6 Midterm Test is a critical assessment designed to evaluate students' understanding of key concepts related to geometric dimensioning and tolerancing, computer-aided design (CAD), and the application of these principles in real-world engineering scenarios. Securing accurate answers and mastery of the material is essential for students aiming to excel in the course and develop a solid foundation for future engineering endeavors. This comprehensive review provides an in-depth analysis of the test answers, key concepts, common pitfalls, and effective strategies for mastering this unit.

Understanding the Scope of Unit 6

Unit 6 in PLTW IED primarily focuses on Geometric Dimensioning and Tolerancing (GD&T), a standardized system used in engineering drawings to communicate allowable variations in form, orientation, and location of features on manufactured parts. This unit builds upon foundational CAD skills and introduces students to precise methods of specifying and interpreting engineering drawings.

Key Topics Covered in Unit 6

- Introduction to GD&T symbols and their meanings
- Feature control frames and their components
- Types of geometric tolerances
- Applying GD&T to CAD models and drawings

- Interpreting and creating dimensioning schemes
- Real-world applications of GD&T in manufacturing and quality control

Core Concepts and Their Significance

Understanding the core concepts of GD&T is vital for accurately answering test questions. Each concept plays an integral role in ensuring parts fit, function, and are manufacturable within specified tolerances.

Geometric Dimensioning and Tolerancing Symbols

GD&T symbols communicate the allowable variation for features on a part. The primary symbols include:

- Flatness: Ensures a surface is within a specified flatness zone.
- Straightness: Controls the straightness of a line or axis.
- Circularity (Roundness): Ensures a feature's cross-section is within a circular tolerance zone.
- Cylindricity: Controls the form of a cylindrical surface.
- Perpendicularity: Ensures a feature is at a right angle to a datum.
- Angularity: Controls the angle between a feature and a datum.
- Parallelism: Ensures features are parallel to a datum.
- Position: Controls the location of features relative to datums.
- Concentricity: Ensures the axes of two features are aligned.
- Symmetry: Ensures features are mirror images about a center plane.

Feature Control Frames

A feature control frame is a rectangular box that contains the GD&T symbol, the tolerance value, and optional modifiers or datums. Its structure generally includes:

- The geometric characteristic symbol
- The tolerance value (e.g., 0.1 mm)
- The material condition modifier (e.g., MMC, LMC, RFS)
- The datum references (e.g., A, B, C)

Tolerance Types and Their Application

- Maximum Material Condition (MMC): The condition where a feature contains the maximum

material, used to control size-related variations.

- Least Material Condition (LMC): The condition where a feature contains the least material.
- Regardless of Feature Size (RFS): Tolerance applies regardless of the feature's size.

Applying GD&T in CAD Models

Students often encounter questions about how to specify or interpret GD&T in CAD software, such as Creo or SolidWorks. Understanding how to apply feature control frames, interpret the symbols, and validate tolerances in CAD assemblies is essential.

Common Test Question Types and Strategies for Answers

Understanding the structure of the test questions can significantly improve performance. Here are common question formats and recommended approaches:

Multiple Choice Questions

- Focus on the meaning of symbols: Recognize what each GD&T symbol indicates.
- Tolerance calculations: Be comfortable converting and calculating tolerances based on given data.
- Interpretation of feature control frames: Identify the correct application or meaning.

Tip: Use process of elimination, especially when options are similar.

True/False Questions

- Test your grasp of fundamental concepts like the purpose of specific symbols or the conditions under which certain tolerances apply.

Tip: Pay attention to qualifiers like MMC or RFS, as they change the meaning.

Drawings and Interpretation

- Given an engineering drawing, identify features that meet or violate GD&T specifications.
- Apply your knowledge to specify appropriate GD&T symbols for features depicted.

Tip: Practice reading and creating feature control frames from drawings.

Calculation and Application Problems

- Solve for positional tolerances, feature sizes, or tolerances based on given parameters.
- Determine the maximum allowable variation for a feature.

Tip: Review formulas and conversion methods related to GD&T tolerances.

Sample Answers to Common Questions

Below are examples of typical questions and the correct approaches or answers, based on the midterm content.

Example 1: Interpreting a Feature Control Frame

Question: A hole feature has a feature control frame that reads: $\varnothing 0.2$ A B RFS. What does this indicate?

Answer:

- The $\varnothing 0.2$ indicates a positional tolerance of 0.2 mm.
- The A B references datums A and B, which are used to locate the feature precisely.
- The RFS (Regardless of Feature Size) indicates the tolerance applies regardless of the hole's actual size.
- This means that the hole's center must be within 0.2 mm of its true position relative to datums A and B, with no consideration of the hole's size variations.

Example 2: Applying Tolerances in CAD

Question: How would you specify a perpendicularity tolerance in CAD software?

Answer:

- Select the feature to be controlled.
- Insert a feature control frame with the perpendicularity symbol (?).
- Set the appropriate tolerance value (e.g., 0.05 mm).
- Assign the relevant datum reference (e.g., A).
- Verify the application by checking the feature's alignment relative to the datum.

Example 3: Calculating Positional Tolerance

Question: A shaft diameter is 20 mm with a positional tolerance of 0.1 mm at MMC. If the diameter is reduced to 19.8 mm, what is the new positional tolerance?

Answer:

- Positional tolerance at MMC is 0.1 mm.
- Since the size is closer to LMC, the positional tolerance may increase if specified (dependent on the modifier).
- Typically, the positional tolerance at LMC is larger unless RFS is specified.
- If the tolerance is specified at MMC with an MMC modifier, the new tolerance can be calculated proportionally.
- For example, if the positional tolerance is proportional, the new tolerance = $(\text{Size at LMC} / \text{MMC}) \times \text{Original tolerance}$.
- Given the details, the student should refer to the specific formula provided in class or the standards.

Effective Study Tips for the Midterm

Achieving success in the Unit 6 Midterm requires strategic preparation. Here are some proven tips:

- Keep track of remaining time and adjust pace accordingly.

Sample Mechanical Objective Questions and Answers

Below are some representative questions across various topics, accompanied by detailed explanations.

Question 1: Thermodynamics

Q: The efficiency of a Carnot engine operating between two reservoirs at temperatures of 500 K and 300 K is:

- a) 20%
- b) 33.33%
- c) 40%
- d) 60%

Answer: b) 33.33%

Explanation:

Carnot efficiency is given by:

$$\eta = 1 - \frac{T_C}{T_H}$$

]

Where $(T_H = 500\text{K})$ and $(T_C = 300\text{K})$, so:

]

$$\eta = 1 - \frac{300}{500} = 1 - 0.6 = 0.4 \text{ or } 40\%$$

]

However, the options provided indicate 33.33% as the correct answer, which suggests a misprint in options or the question. Based on the standard formula, the correct efficiency is 40%, corresponding to option c).

Note: Always verify calculations carefully.

Question 2: Fluid Mechanics

Q: In laminar flow through a circular pipe, the velocity profile is:

- a) Parabolic
- b) Flat

- c) Sinusoidal
- d) Exponential

Answer: a) Parabolic

Explanation:

In laminar flow, the velocity distribution across the pipe's cross-section follows a parabolic profile, with maximum velocity at the center and zero velocity at the walls (due to no-slip condition). This is described by the Hagen-Poiseuille equation.

Question 3: Strength of Materials

Q: The maximum shear stress in a circular shaft subjected to a bending moment (M) is given by:

- a) $\frac{M}{Z}$
- b) $\frac{M}{I}$
- c) $\frac{M \cdot c}{I}$
- d) $\frac{2M}{\pi r^3}$

Answer: d) $\frac{2M}{\pi r^3}$

Explanation:

For a circular shaft, the maximum shear stress $(\tau_{\max})$ under bending is:

$$\tau_{\max} = \frac{16 M}{\pi d^3} = \frac{2 M}{\pi r^3}$$

since $(d=2r)$.

Additional Tips for Mastering Mechanical Objective Questions

- Focus on High-Yield Topics: Prioritize topics that are frequently tested.

Sample Trade Test Questions and Their Detailed Answers

Below are several example questions with comprehensive explanations to help candidates prepare effectively.

Question 1: Reading a Technical Drawing

Given a technical drawing showing a shaft with keyways, identify the standard dimensions for keyway width and depth according to ISO standards.

Answer:

According to ISO 773 standard, the keyway dimensions depend on the shaft diameter. For example:

- For a shaft diameter of 20 mm, the keyway width is typically 4 mm, and the depth is 2.5 mm.
- For a shaft diameter of 40 mm, the keyway width is 8 mm, and the depth is 4 mm.

Always refer to the relevant ISO standard or engineering drawing notes for specific dimensions.

Question 2: Calculating Load and Stress

If a bolt with a diameter of 10 mm is tightened to a torque of 50 Nm, estimate the tension force in the bolt assuming a coefficient of friction of 0.2.

Answer:

Using the simplified torque-tension relationship:

$$T = K \times F \times d$$

Where:

- T = torque (Nm)
- K = torque coefficient (usually around 0.2 for dry threads)
- F = tension force (N)

- d = bolt diameter (m)

Rearranged:

$$F = \frac{T}{K \times d}$$

Convert units:

- $d = 10 \text{ mm} = 0.01 \text{ m}$

- $T = 50 \text{ Nm}$

Calculate:

$$F = \frac{50}{0.2 \times 0.01} = \frac{50}{0.002} = 25,000 \text{ N}$$

So, the tension force in the bolt is approximately 25 kN.

Question 3: Troubleshooting a Mechanical System

A gear train is slipping under load. What could be the causes, and how would you rectify the issue?

Answer:

Possible causes include:

- Worn or damaged gears causing poor engagement.
- Incorrect gear meshing or misalignment.
- Insufficient lubrication leading to increased friction.
- Loose gear shafts or mounting hardware.

Rectification steps:

- Inspect gears for wear or damage; replace if necessary.
- Check and adjust gear alignment and meshing.
- Lubricate gears with appropriate lubricant.
