Understanding Solubility and Its Importance

What Is Solubility?

Solubility refers to the maximum amount of a solute that can dissolve in a solvent at a given temperature and pressure to form a saturated solution. It is typically expressed in units such as grams per 100 milliliters of solvent, molarity, or molality. Solubility varies widely among different substances and is influenced by factors including temperature, pressure, and the nature of the solvent and solute.

Why Is Solubility Temperature-Dependent?

Most substances exhibit a change in solubility with temperature. For many solids dissolved in liquids, solubility increases as temperature rises, although there are exceptions.
