Analyzing Key Questions from the 2014 Exemplar

Exam questions in the 2014 exemplar are designed to test both theoretical knowledge and practical application. Below are examples of typical question types and how to approach them.

Data Handling and Graphs

Sample Question:

A pie chart shows the distribution of students' preferred sports. If 30% prefer soccer, 25% prefer basketball, and the remaining prefer other sports, how many students preferred other sports if there are 200 students in total?

Approach:

- Calculate the percentage for other sports: $100\% - (30\% + 25\%) = 45\%$

- Find the number of students: $45\% \text{ of } 200 = 0.45 \times 200 = 90 \text{ students}$

Financial Calculations

Sample Question:

Calculate the total amount payable on a loan of R10,000 at an interest rate of 12% per annum simple interest over 3 years.

Approach:

- Use the simple interest formula:

Interest = Principal $\times$ Rate $\times$ Time

Interest = $10,000 \times 0.12 \times 3 = \text{R}3,600$

- Total amount payable = Principal + Interest = $\text{R}10,000 + \text{R}3,600 = \text{R}13,600$

Measurement and Geometry

Sample Question:

Calculate the volume of a cylinder with a radius of 3 meters and height of 5 meters.

Approach:

- Use the volume formula for a cylinder: $V = \pi r^2 h$
- $V = 3.14 \times 3^2 \times 5 = 3.14 \times 9 \times 5 = 3.14 \times 45 \approx 141.3 \text{ m}^3$

- The interpretation should connect the statistics to business performance, discussing consistency, variability, or growth.

Sample Response:

Calculating the mean:

- Sum of sales over 12 months = R120,000
- Mean = $R120,000 / 12 = R10,000$

Calculating the median:

- Ordered sales data (example): R8,000, R9,000, R9,500, R10,000, R10,500, R11,000, R11,500, R12,000, R12,500, R13,000, R13,500, R14,000
- Median (middle two values): R10,500 and R11,000
- Median = $(R10,500 + R11,000) / 2 = R10,750$

Interpretation:

The average monthly sales are R10,000, with a median slightly higher at R10,750, indicating a relatively consistent sales pattern with some months performing better than others. The proximity of mean and median suggests stability in sales figures, which is positive for planning and forecasting.

Students employing Vedic Maths techniques often outperform peers in exams due to faster problem-solving abilities. It's particularly advantageous in timed tests like competitive exams (e.g., IIT-JEE, CAT, GRE).

Everyday Life Calculations

From calculating discounts, interest rates, or tips to quick mental math during shopping or budgeting, Vedic Maths offers practical solutions.

Professional and Business Use

Business professionals benefit from rapid calculations related to finance, accounting, and data analysis, thereby improving efficiency.

Teaching and Curriculum Development

Incorporating Vedic Maths into school curricula can make math more engaging and accessible, fostering a love for the subject among students.

Deep Dive into Key Techniques and Examples

Multiplication Using Vertically and Crosswise

This technique simplifies multiplying large numbers mentally:

- Break down numbers into parts.
- Cross-multiply and add intermediate results.

- Example: 23×45
- Multiply units: $3 \times 5 = 15$
- Cross-multiplied sum: $(2 \times 5) + (3 \times 4) = 10 + 12 = 22$
- Multiply tens: $2 \times 4 = 8$
- Combine: $8 \text{ (hundreds)} + 22 \text{ (tens and ones)} = 1030 + 15 = 1035$

Squaring Numbers Ending in 5

A simple rule:

- For a number ending in 5, multiply the preceding digit by its successor and append 25.
- Example: 75^2
- Preceding digit: 7
- $7 \times (7 + 1) = 7 \times 8 = 56$
- Append 25: 5625
- So, $75^2 = 5625$

Division Using the Nikhilam Sutra

This technique simplifies division by transforming it into easier calculations:

- Find how far the divisor is from a base (like 10, 100, etc.).
- Adjust numerator accordingly, perform simpler division, and then adjust the result.

Algebraic Identities

Vedic Maths leverages classical identities for quick calculations:

- Square of sum: $(a + b)^2 = a^2 + 2ab + b^2$
- Difference of squares: $a^2 - b^2 = (a + b)(a - b)$

These identities are applied mentally, reducing the complexity of algebraic manipulations.
