Foundations of Molecular Cell Biology

Cell Structure and Function

Cells are the basic units of life, and their functions are maintained by a highly organized molecular architecture.

- **Prokaryotic vs. Eukaryotic Cells:** Prokaryotic cells lack a nucleus and membrane-bound organelles, while eukaryotic cells possess a nucleus and complex organelles such as mitochondria, endoplasmic reticulum, and Golgi apparatus.
- **Cell Membrane:** Composed primarily of phospholipids and proteins, it regulates the intake and outflow of substances, maintaining homeostasis.
- **Organelles and their roles:** Each organelle has specific functions, such as energy production in mitochondria or protein synthesis in the rough endoplasmic reticulum.

Macromolecules in Cells

The cell's function depends on the synthesis, regulation, and interaction of key macromolecules.

- **DNA (Deoxyribonucleic Acid):** Carries genetic information, dictating cellular activities and heredity.

- **RNA (Ribonucleic Acid):** Involved in protein synthesis and gene regulation.
- **Proteins:** Serve as enzymes, structural components, signaling molecules, and regulators.
- **Lipids:** Form the cell membrane and participate in signaling pathways.

DNA Structure and Replication

DNA Architecture

Albert Bruce's work has illuminated the double helix structure of DNA, emphasizing the significance of base pairing and molecular stability.

- **Double Helix:** Composed of two antiparallel strands wound around each other.
- **Nucleotide Composition:** Consists of a sugar (deoxyribose), a phosphate group, and a nitrogenous base (adenine, thymine, cytosine, guanine).
- **Complementary Base Pairing:** Adenine pairs with thymine via two hydrogen bonds; cytosine pairs with guanine via three hydrogen bonds.

DNA Replication Mechanism

Understanding DNA replication is essential for comprehending heredity and cellular division.

- **Initiation:** Origin of replication sites are recognized, and unwinding begins with helicase enzymes.
- **Elongation:** DNA polymerases synthesize new strands in a 5' to 3' direction, using the original strands as templates.
- **Termination:** Replication forks meet, and newly synthesized DNA is proofread and repaired to ensure fidelity.

Albert Bruce's studies have contributed to elucidating the enzyme functions and regulatory factors involved in replication fidelity and timing.

Gene Expression and Regulation

Transcription: From DNA to RNA

Gene expression begins with transcription, a process where genetic information in DNA is transcribed into messenger RNA (mRNA).

- **Initiation:** RNA polymerase binds to promoter regions, with transcription factors facilitating this process.
- **Elongation:** RNA polymerase synthesizes a complementary RNA strand from the DNA template.
- **Termination:** The process concludes when the RNA polymerase reaches terminator sequences, releasing the mRNA.

Translation: Protein Synthesis

The mRNA is translated into a functional protein at the ribosome.

- **Initiation:** The small ribosomal subunit binds mRNA; the start codon (AUG) recruits the large subunit and initiator tRNA.
- **Elongation:** tRNAs bring amino acids corresponding to codons, elongating the polypeptide chain.
- **Termination:** When a stop codon is encountered, the release factors promote disassembly of the complex, releasing the finished protein.

Gene Regulation Mechanisms

Albert Bruce's research highlights how cells control gene expression to respond to internal and external cues.
