Common Diseases of the Skin in Andrews? Dermatology

Andrews? covers a wide array of dermatological conditions. Here, we focus on some of the most prevalent and clinically significant diseases:

- Infectious Diseases

a. Bacterial Infections

- Impetigo: Common in children, characterized by honey-colored crusted lesions.
- Cellulitis: Diffuse bacterial infection of the dermis and subcutaneous tissue, presenting with redness, warmth, and swelling.

Question What are the common clinical features of acne vulgaris as described in Andrews' Diseases of the Skin? Acne vulgaris typically presents with comedones (whiteheads and blackheads), inflammatory papules, pustules, nodules, and in severe cases, cysts. It commonly affects the face, back, and chest, often associated with increased sebaceous gland activity and *Propionibacterium acnes* colonization. **Answer** How does Andrews' describe the clinical presentation of

psoriasis? Psoriasis is characterized by well-demarcated, erythematous plaques with silvery-white scales, commonly appearing on the elbows, knees, scalp, and lower back. Auspitz sign (pinpoint bleeding when scales are removed) and Koebner phenomenon (lesion development after trauma) are notable features. What are the key features of eczema (atopic dermatitis) according to Andrews'? Eczema presents with itchy, erythematous, and often oozy or crusted lesions, typically affecting flexural areas like the elbows and knees in children, and the hands and face in adults. Chronic cases show lichenification and xerosis. It is associated with a personal or family history of atopy. How does Andrews' describe the clinical signs of basal cell carcinoma? Basal cell carcinoma often appears as a pearly, translucent papule or nodule with telangiectasia, sometimes ulcerated with a rolled border. It commonly occurs on sun-exposed areas such as the face and neck, and tends to grow slowly with a low metastatic potential. What is the typical presentation of melanoma in clinical dermatology as per Andrews'? Melanoma usually presents as a pigmented lesion with asymmetry, irregular borders, multiple colors, and diameter greater than 6mm. The 'ABCDE' criteria (Asymmetry, Border irregularity, Color variation, Diameter >6mm, Evolving) are key for suspicion. It can arise de novo or from pre-existing nevi. According to Andrews', what are the clinical features of tinea corporis (ringworm)? Tinea corporis presents as annular, erythematous, scaly plaques with advancing edges that may be raised and active, often with central clearing. It is caused by dermatophyte fungi and commonly affects exposed skin areas such as the arms, legs, and trunk. What are the distinguishing clinical features of seborrheic dermatitis described in Andrews'? Seborrheic dermatitis manifests as greasy, yellowish scales and erythema primarily affecting sebaceous areas like the scalp, face (especially around the nose and eyebrows), and chest. It often causes dandruff and may be associated with *Malassezia* yeast colonization.
