To illustrate the kind of questions you can expect, let's analyze a typical problem from the differential equations section:

Question: Solve the differential equation $dy/dx = y / (x + 1)$ with the initial condition $y(0) = 2$.

Approach:

- Recognize that this is a separable differential equation.
- Separate variables: $dy/y = dx / (x + 1)$.
- Integrate both sides:
- $\int (1/y) dy = \int (1/(x+1)) dx$.
- Result: $\ln|y| = \ln|x + 1| + C$.
- Exponentiate to solve for y:
- $|y| = e^{\ln|x+1| + C} = e^{\ln|x+1|} e^C = |x + 1| e^C$.
- Let $K = e^C$, then $y = K (x + 1)$.
- Use the initial condition $y(0) = 2$:
- $2 = K (0 + 1) \Rightarrow K = 2$.
- Final solution: $y = 2(x + 1)$.

This exemplifies the typical problem-solving approach for differential equations: recognizing the method, executing integration, applying initial conditions, and presenting the solution neatly.

Sample Numerical Methods Objective Questions and Answers

To illustrate the scope and depth of typical questions, here are some curated examples with detailed explanations:

Question 1: Root-Finding Method

Which of the following methods guarantees convergence to a root if the initial guess is sufficiently close?

- a) Bisection Method
- b) Secant Method
- c) Newton-Raphson Method
- d) All of the above

Answer: d) All of the above

Explanation:

- The Bisection Method converges monotonically provided the initial interval brackets the root.
- The Secant Method converges if the initial guesses are close to the actual root, but it does not guarantee convergence for all functions.
- The Newton-Raphson Method converges quadratically if the initial guess is sufficiently close and the function satisfies certain smoothness criteria.

Thus, while all these methods have convergence properties under specific conditions, the safest answer considering the question's phrasing is d) All of the above.

Question 2: Numerical Integration

Which rule provides the most accurate approximation for the integral $\int_a^b f(x) dx$ when $f(x)$ is sufficiently smooth?

- a) Trapezoidal Rule
- b) Simpson's Rule
- c) Midpoint Rule
- d) Rectangular Rule

Answer: b) Simpson's Rule

Explanation:

Simpson's Rule approximates the integral by fitting quadratic polynomials through the data points and generally offers higher accuracy than the Trapezoidal Rule and Midpoint Rule for smooth

functions, especially when the function is well-behaved over the interval.

Question 3: Numerical Differentiation

The finite difference approximation for the derivative $f'(x)$ using the forward difference formula is:

- a) $\frac{f(x+h) - f(x)}{h}$
- b) $\frac{f(x) - f(x-h)}{h}$
- c) $\frac{f(x+h) - f(x-h)}{2h}$
- d) None of the above

Answer: a) $\frac{f(x+h) - f(x)}{h}$

Explanation:

The forward difference formula estimates the derivative based on the function value at x and $x+h$, making option (a) correct. The other options represent different difference schemes.
