Introduction to Ultrasonography in Marine Mammals

Ultrasonography, or ultrasound imaging, utilizes high-frequency sound waves to produce real-time images of internal structures. Its advantages include safety (non-ionizing radiation), portability, and the ability to perform dynamic assessments. In dolphins, ultrasound facilitates the evaluation of organs such as the liver, kidneys, spleen, gastrointestinal tract, reproductive organs, and lymph nodes.

Given the anatomical and physiological differences from terrestrial mammals, performing ultrasonography in dolphins requires specialized knowledge of their unique thoracic and abdominal anatomy, as well as adaptations in technique and equipment.

Principles and Equipment for Dolphin Abdominal Ultrasonography

Ultrasound Equipment Specifications

- **Transducer Selection:** A high-frequency linear array transducer (7.5-12 MHz) is ideal for superficial structures, while lower frequencies (3-5 MHz) may be necessary for deeper organs in larger or deep-chested individuals.
- **Portable Machines:** Handheld portable ultrasound units increase flexibility and enable field diagnostics.
- **Coupling Medium:** Ultrasonography gel or water immersion techniques are used to optimize sound wave transmission, especially considering the aquatic environment.

Preparatory Considerations

- **Animal Restraint:** Dolphins are typically restrained with minimal stress using trained behavior,

physical barriers, or sedation when necessary.

- Positioning: The animal is usually placed in dorsal or lateral recumbency, with adjustments made based on the targeted organ.
- Environmental Factors: Water temperature, ambient noise, and animal comfort influence the quality of imaging.

Anatomical Landmarks and Ultrasonographic Windows

Understanding dolphin anatomy is paramount for accurate ultrasonographic assessment.

Key Abdominal Organs and Their Sonographic Appearance

- Liver: The largest abdominal organ, located cranially and to the right, with a homogeneous echotexture.
- Kidneys: Paired, bean-shaped structures situated dorsally, caudal to the liver and near the vertebral column.
- Spleen: Located on the left side, with a homogenous, hypoechoic texture.
- Gastrointestinal Tract: Includes stomach, intestines, and associated lymphoid tissue, with variable echogenicity based on contents.
- Reproductive organs: In females, ovaries and uterus; in males, testes are usually located in the caudal abdomen or scrotal sac.

Ultrasound Windows and Approaches

- Subcostal approach: Using the ventral midline or lateral flank to visualize deep structures.
- Paraspinal approach: To access dorsal organs like the kidneys.
- Water immersion: For enhanced visualization when combined with water-based coupling.

Standard Ultrasonographic Examination Protocol
